

Requirement Analysis

Functional Requirements

The project requires a test user, four custom roles, a custom Institution Details table, sample records, and separate ACLs for READ, CREATE, WRITE, and DELETE operations.

User Requirements

The test user must be created with User ID EEE User, First Name EEE, Last Name User, and email `eeeuser@gmail.com`. The four roles `bb1`, `bb2`, `bb3`, and `bb4` are assigned to the test user.

Role Requirements

The required roles are `bb1`, `bb2`, `bb3`, and `bb4`. Each role is used as a required role for a particular ACL operation.

Table Requirements

The table is named Institution Details with the system name `u_institution_details`. It contains Student Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number, and Description fields. Branch contains ECE, EEE, and CSE choices.

Security Requirements

The READ ACL must be active and advanced, require `bb1`, and use `Branch = EEE` as the data condition. The advanced script must allow administrators and users with `bb1` and reject users who do not satisfy the rule. CREATE requires `bb2`, WRITE requires `bb3`, and DELETE requires `bb4`.

Validation Requirements

The configuration must be tested by impersonating the EEE User and an administrator. The results must confirm the expected access for EEE records and the unrestricted access available to administrators.
