

Project Development Phase

User and Role Setup

The development begins by creating the EEE User and the four custom roles. The roles bb1, bb2, bb3, and bb4 are assigned to the user for testing the complete access configuration.

Custom Table Development

The Institution Details table is created with the system name u_institution_details. The required fields are added and sample records are created with different Branch values such as ECE, EEE, and CSE.

READ ACL Development

A record-level READ ACL is created for u_institution_details. It is active and advanced, requires bb1, and uses Branch = EEE as the data condition. The script permits administrators and users with bb1 and rejects users who do not satisfy the rule.

CREATE ACL Development

A separate record-level CREATE ACL is created. It is active, requires bb2, and has no data condition. A user with bb1 and bb2 can access the EEE records and receives the New button.

WRITE ACL Development

The WRITE ACL is created as an active record ACL requiring bb3. No data condition is configured. A user with bb1, bb2, and bb3 can view and modify the EEE records and use the New button.

DELETE ACL Development

The DELETE ACL is created as an active record ACL requiring bb4. No data condition is configured. A user with all four roles can view, create, edit, and delete the EEE branch records.

Development Result

The completed development provides a layered access-control structure using roles, ACL operations, the Branch field, and the advanced security script.
