

Project Demonstration

Demonstration Objective

The demonstration shows the working behavior of the ACL configuration and verifies that access changes according to user roles and the Branch value.

Step 1 – User and Roles

Open the EEE User record and show the assigned roles. The four roles, bb1, bb2, bb3, and bb4, are checked before demonstrating the ACL operations.

Step 2 – Custom Table

Open the Institution Details table and display the configured fields. Show sample records containing ECE, EEE, and CSE branch values.

Step 3 – READ Access

Impersonate the EEE User and open the u_institution_details list. Demonstrate access to the EEE branch records. Then impersonate the administrator and open the same list to show unrestricted access.

Step 4 – CREATE Access

Use a user with the required bb1 and bb2 roles to demonstrate the CREATE permission. The New button should be available for creating records.

Step 5 – WRITE Access

Use a user with bb1, bb2, and bb3 to demonstrate the WRITE permission. Open an allowed record and verify that it can be modified.

Step 6 – DELETE Access

Use a user with all four roles to demonstrate the DELETE permission. Verify that the permitted EEE branch record can be deleted.

Final Result

The demonstration confirms that the ACLs separate the four operations and that the READ ACL uses the Branch condition and advanced script to control access.
